

SEALING ORGANIC LIGHT EMITTING DEVICE DISPLAYS

Abstract of the Disclosure

An organic light emitting device display may be formed
of at least two moisture impervious layers sealed to one
5 another using an epoxy material having a desiccant formed
within the epoxy material. Any moisture or other solvents
that tend to penetrate into the region between the front
and back plates of the display where the organic light
emitting material resides, will be trapped by the desiccant
10 within the filler material.
